

CIO-DIO48 and CIO-DIO48H

48-Channel Digital I/O Board For IBM PC and Compatibles

\$189

- ✓ 48 TTL Digital I/O Lines
- ✓ Single 50-Pin Connector Carries All 48 Digital Lines plus Power

The CIO-DIO48 can control 48 devices or sense 48 contact closures from a single half-size card in a pc. The CIO-DIO48 employs two 8255 parallel peripheral interface chips which are pro-programmable in three modes; simple byte input or output or strobed I/O. The 8255 is simple to program. The CIO-DIO48 can provide 2.5 mA to activate other chips, but not enough for LED's or relays. The CIO-DIO48H can source 15 mA or source 64 mA, enough for switching most relays and SSR's. Each 8255 has 24 I/O lines. The chip is configured as three ports. Two ports, A & B, are 8-bits wide, while port C may be an 8-bit port or two 4-bit ports. Individual ports may be configured as input or output, and are written to or read from as a unit.

The CIO-DIO48 is a member of a family of digital I/O boards which use a 50-pin connector. Applications can easily be sized from 48 to 192 digital I/O points or more. Software is extensible to multiple points and all the accessories, including screw terminal boards, electro-mechanical relay boards and solid state relay boards interface to the same connector, regardless of which digital I/O board is used.

Base Address

To program and control the DIO board, the PC writes to and reads from the I/O address assigned to the board. The DIO boards' address is set by selecting a base address via the base switch.

Cabling and Connection

Cabling to the CIO-DIO48 is via standard 50-pin, 0.10" spacing AMP type ribbon cable connectors. Each cable carries 48 digital I/O lines, +5 V and ground.

The CIO-MINI50 provides 50 12 to 22 AWG screw terminals. The CIO-SPADE50 provides terminals for 50 spade type connections. The SSR-RACK24 mounts 24 solid state relays, and the CIO-ERB24 mounts 24 electro-mechanical relays.
