## DESCRIPTION

The World Series (W Series) consists of single and multiple output open frame power supplies. Each model uses a specially designed split bobbin transformer enabling the units to meet the most stringent international safety standards for leakage and isolation. As the name World Series implies, the units are designed to operate from any worldwide input voltage. Multiples have anti-latch circuitry to handle high surge and cross coupled loads. W Series supplies come in 13 different chassis configurations, each conforming to the industry standard footprints. All outputs are isolated and have barrier block output terminations. These features combine to make the W Series an ideal choice for critical commercial and industrial applications.

Corresponding ratings separated by slash marks are alternate field selectable ratings for the designated output. All units have anti-latch circuitry to handle high surge and cross coupled loads.

## CROWBAR OVERVOLTAGE PROTECTOR

All 5 volt W Series single output units have a built-in fixed crowbar overvoltage protector. Multiples also have this type of built-in crowbar on Output \#1, when its voltage is specified as 5 volts only. Accessory crowbar protectors are available for other models, as shown in the table below.
